

Variable-Rate N Fertilization of Wheat and Corn in Virginia

Wade Thomason, VT
Steve Phillips, IPNI
Paul David, VCE
Mark Alley, VT

INCREASING N FERTILIZER EFFICIENCY

- Match Timing of Fertilization with Crop Demand

But... if it's been a wet early summer...

... if it's been a dry early summer...

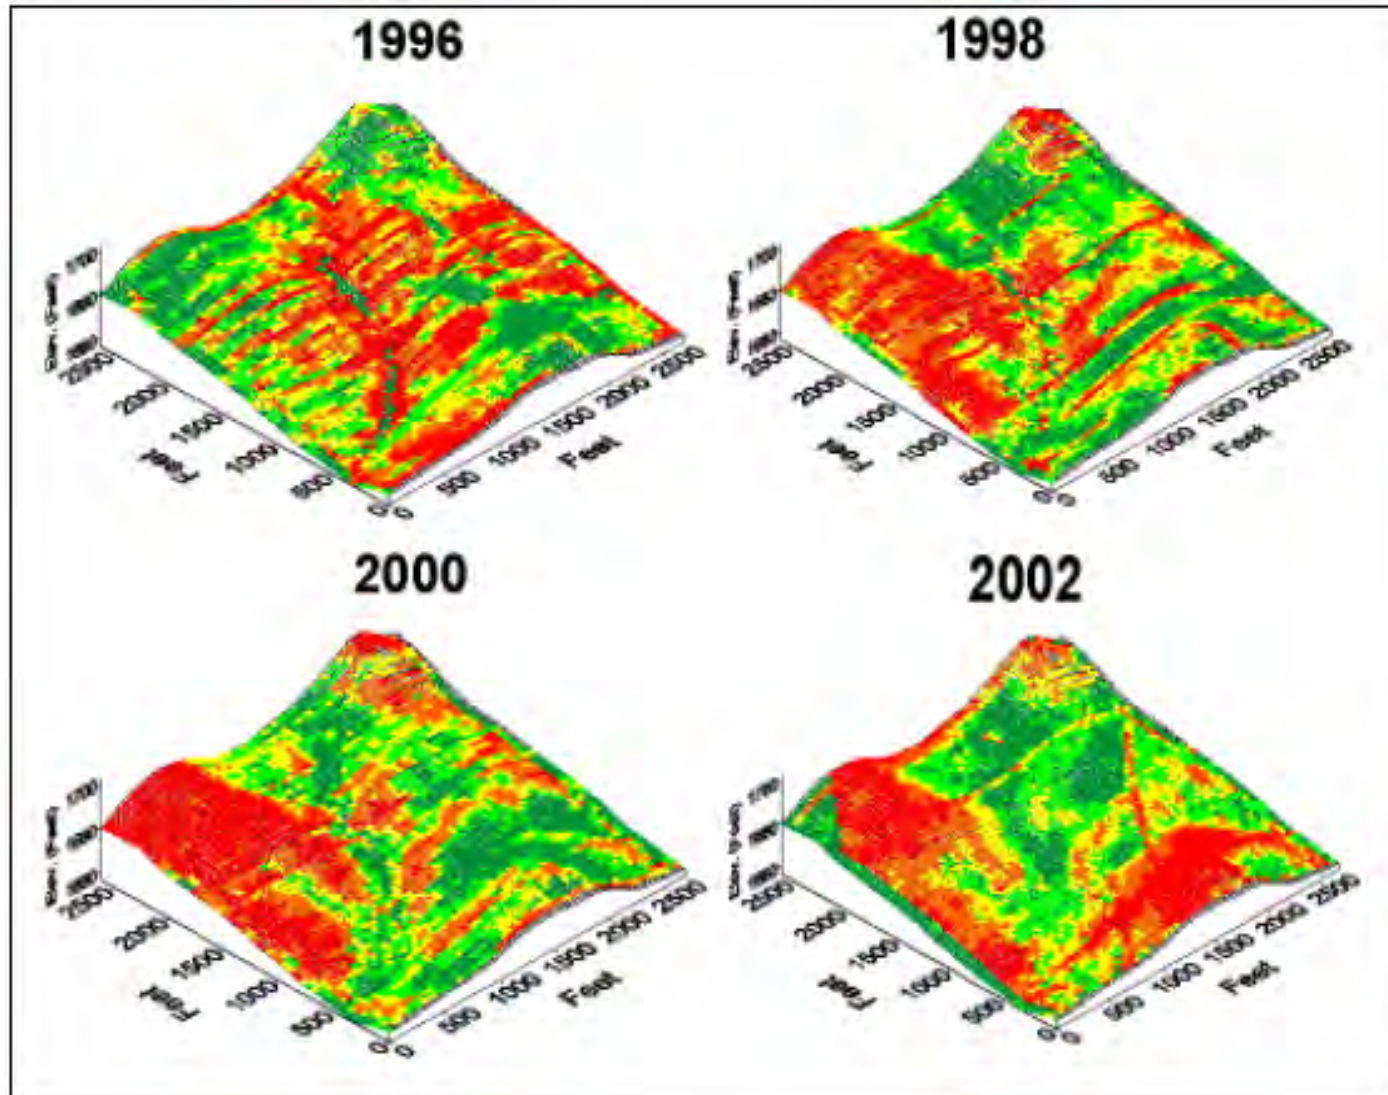

- More Knowledge of Crop N Need
 - 1 lb N/bu of expected yield

TEMPORAL VARIABILITY

TEMPORAL VARIABILITY

SPATIAL VARIABILITY

- 60 acre field in Caroline County
- Wheat yields: 44 to 80 bu/acre
- Corn yields: 85 to 178 bu/acre

ADDRESSING THIS VARIABILITY

- Temporal
 - Shoot from the hip
 - PSNT
 - Tissue tests
 - Chlorophyll meter
 - Precision Ag Technologies
- Spatial
 - Soil map
 - Yield/History map

In-Season Remote Sensing

- Satellite
- Aerial photography
- Ground-based Sensing

Questions.... Answers

- Do Optimum N rates Vary From One Year to the Next in the Same Field?
- Can We Measure and Address this Variability?
- Can N Rates be Adjusted based on Early-Mid Season Measurements?
- Can the Responsiveness to N be Predicted?

OPTICAL SENSORS

BACKGROUND

- ~60 sites across Virginia since 2000
- Irrigated and non-irrigated
- Conventional and no till
- Various rotations, hybrids, varieties, and soil types
- Wide range of preplant, starter, and in-season N rates (including VR)
- Collected spectral measurements and an assortment of plant physical and chemical characteristics at various growth stages
- Determine grain yield

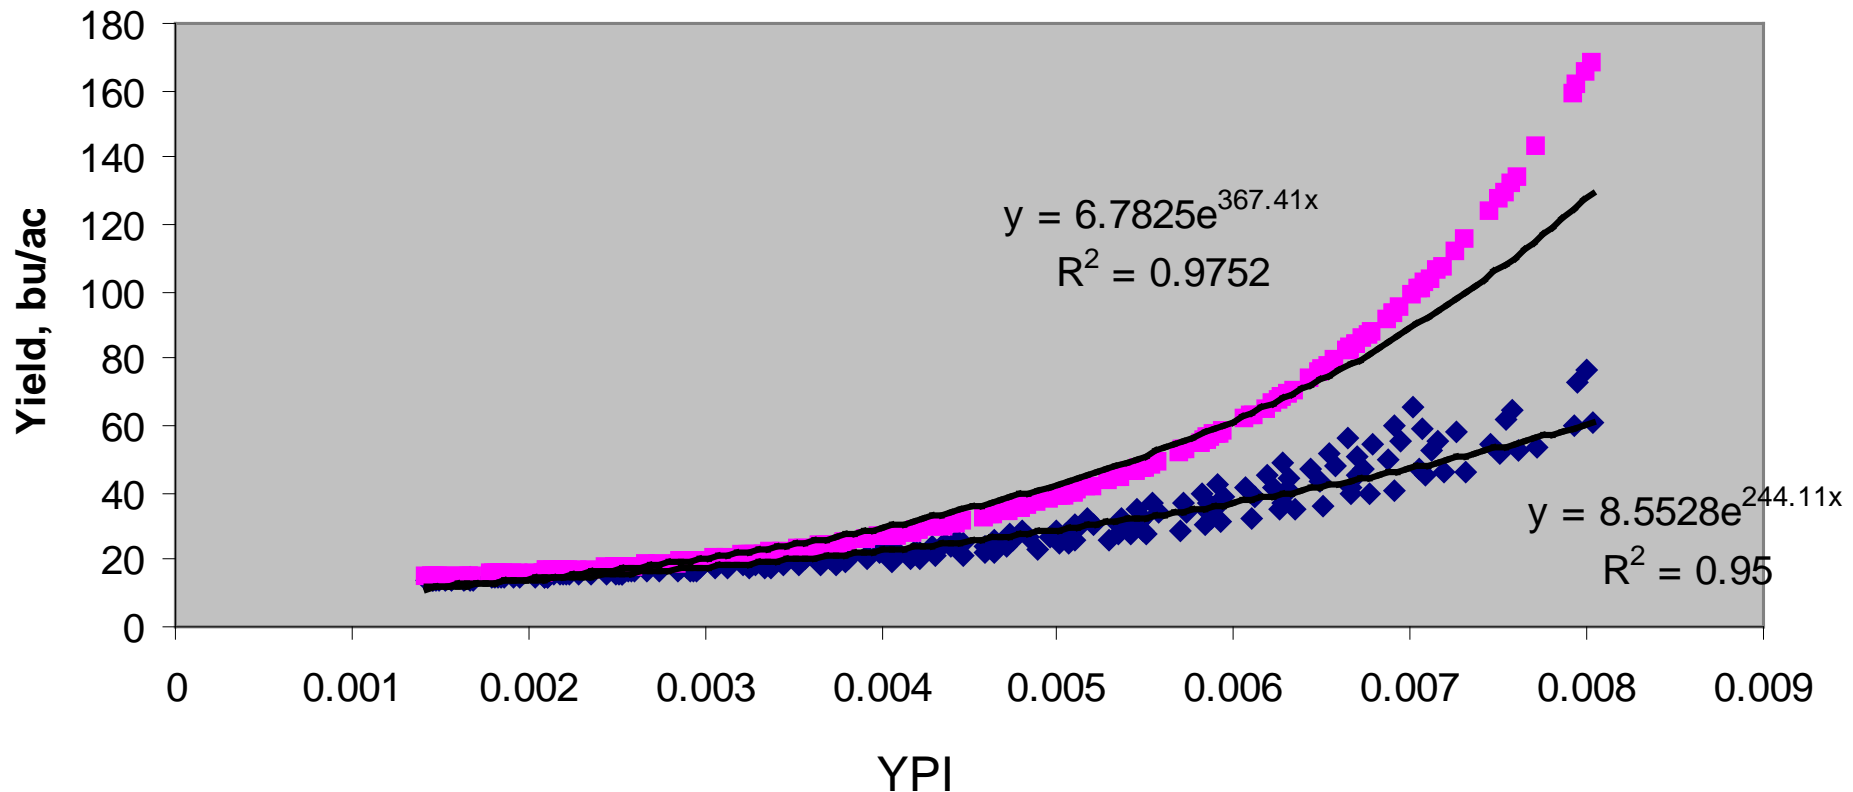

VIRGINIA APPROACH

- Generated calibration models for wheat and corn grown in the Mid-Atlantic

VIRGINIA APPROACH

- Generated calibration models for wheat and corn grown in the Mid-Atlantic

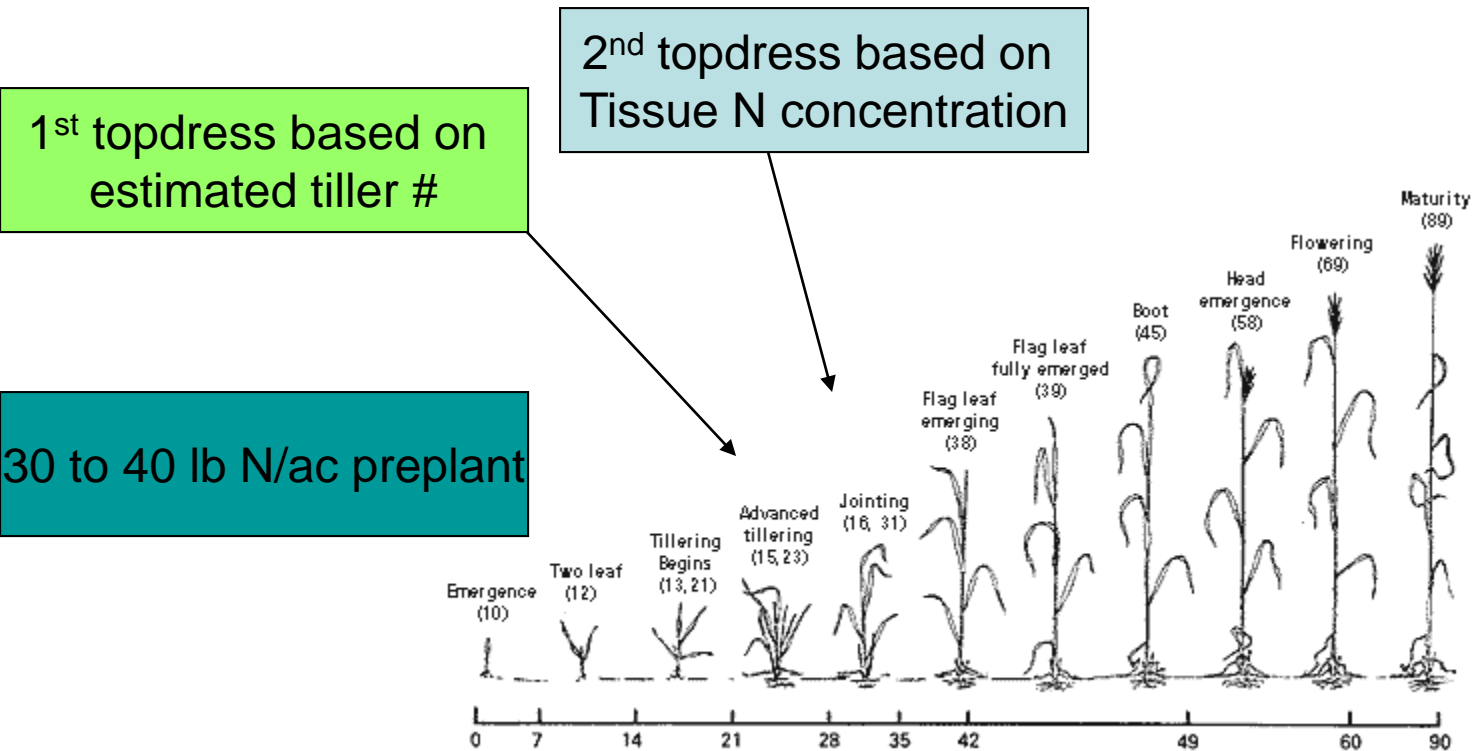

VIRGINIA APPROACH

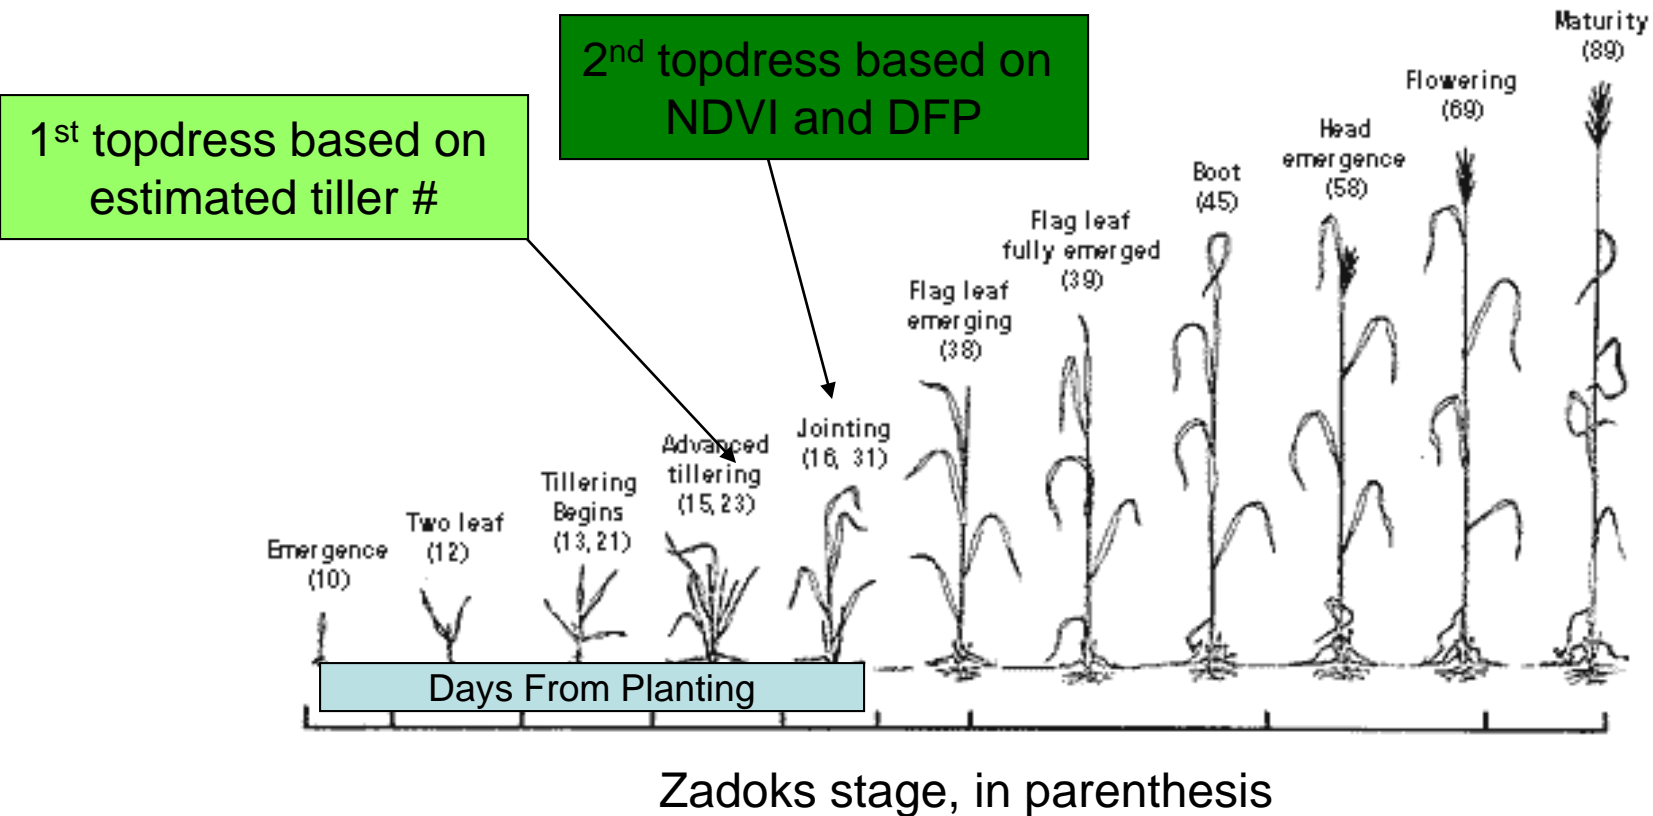

- Generated calibration models for wheat and corn grown in the Mid-Atlantic
- Developed N fertilization algorithms for both crops

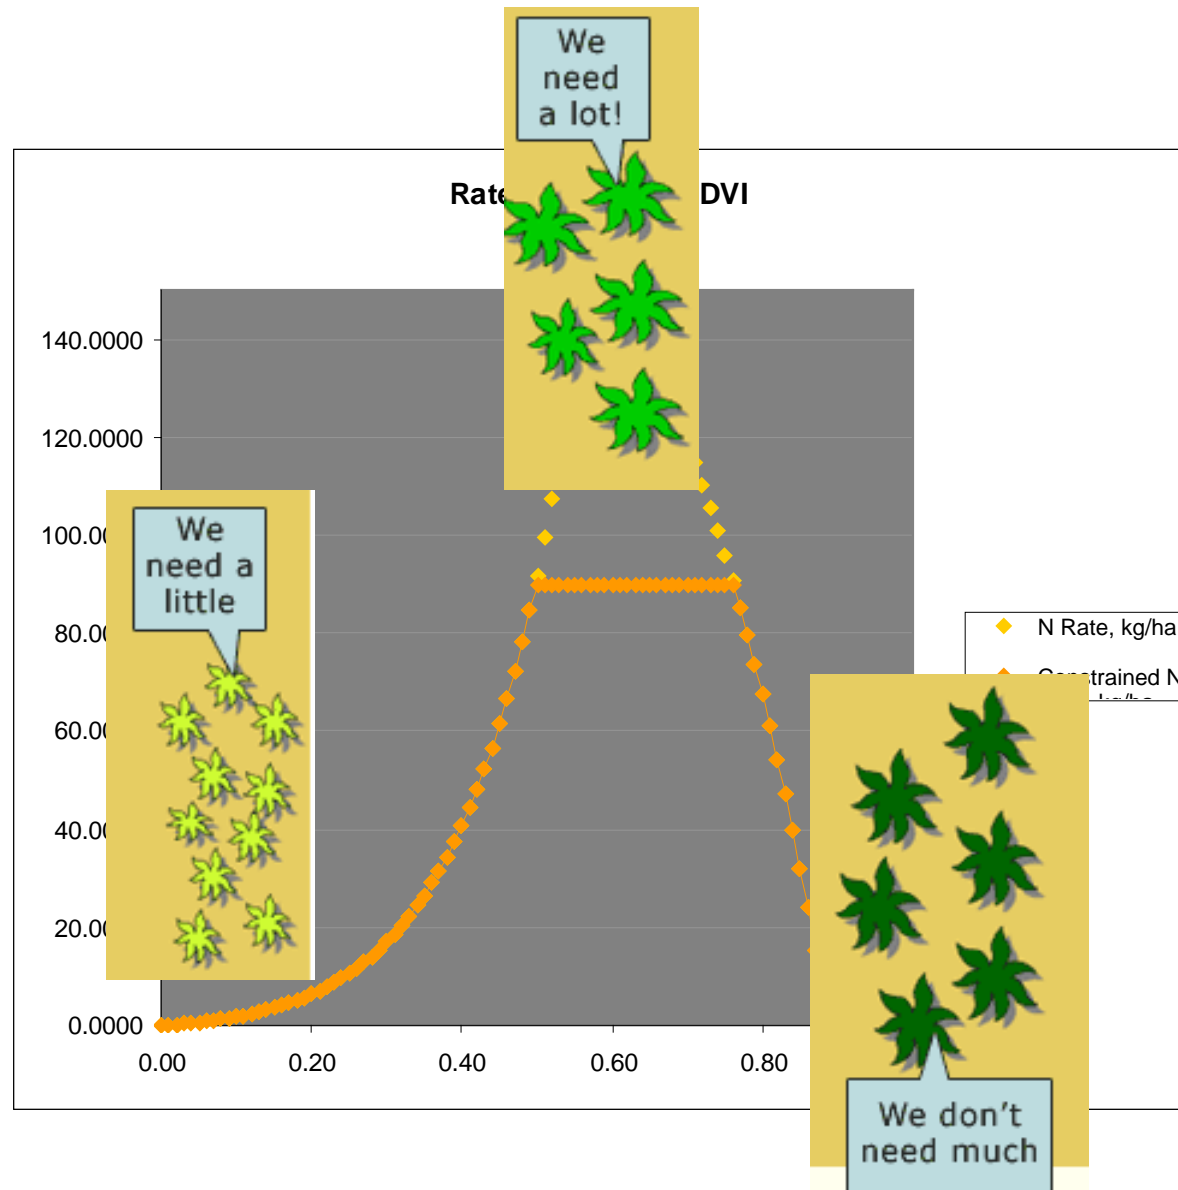

In-season N management

In-season N timing

Wheat N Rate Algorithm

What's Needed

- Reference Strips
 - Difference between:
 - High N reference (best possible with more than adequate N)
 - Low N reference (0 N applied)

And

- Area currently in sensor's view.

VIRGINIA APPROACH - Wheat

TARGET NDVI	LOW REFERENCE	HIGH REFERENCE	GS 25 N	DAP	MAX YIELD	MAX N	NUE	N RATE

VIRGINIA APPROACH

- Generated calibration models for wheat and corn grown in the Mid-Atlantic
- Developed N fertilization algorithms for both crops
- Validated these rate equations for performance

EXPERIMENTAL PROCEDURES

- Diverse locs; RCBD; 3-8 reps
- Plot size: 60 by 250 to 500 ft
- In-season N:
 - 4-5 Fixed Rates
 - 1 Standard Rate
 - 1 Variable Rate
- Grain Yield
- Sprague Coupe 220 w/ 60 ft boom and GreenSeeker RT200
- Raven 440 flow rate controller

-  Average: Single N rate determine using Greenseeker® (VA algorithm)
 -  Variable: Variable Nitrogen rate determined using Greenseeker® Virginia Algorithm
 -  Standard: Nitrogen rate determined based on GS 30 tissue test (Standard Virginia recommendation system)
 -  Greenseeker ® : Variable N rates determined using default Greenseeker ® wheat algorithm
- 0 – 75 N kg/ha: (numerical rates): Predetermined Nitrogen rates applied in lb/acres

As-applied N rate, tissue test (STD) vs. Greenseeker (GS) recommended rate

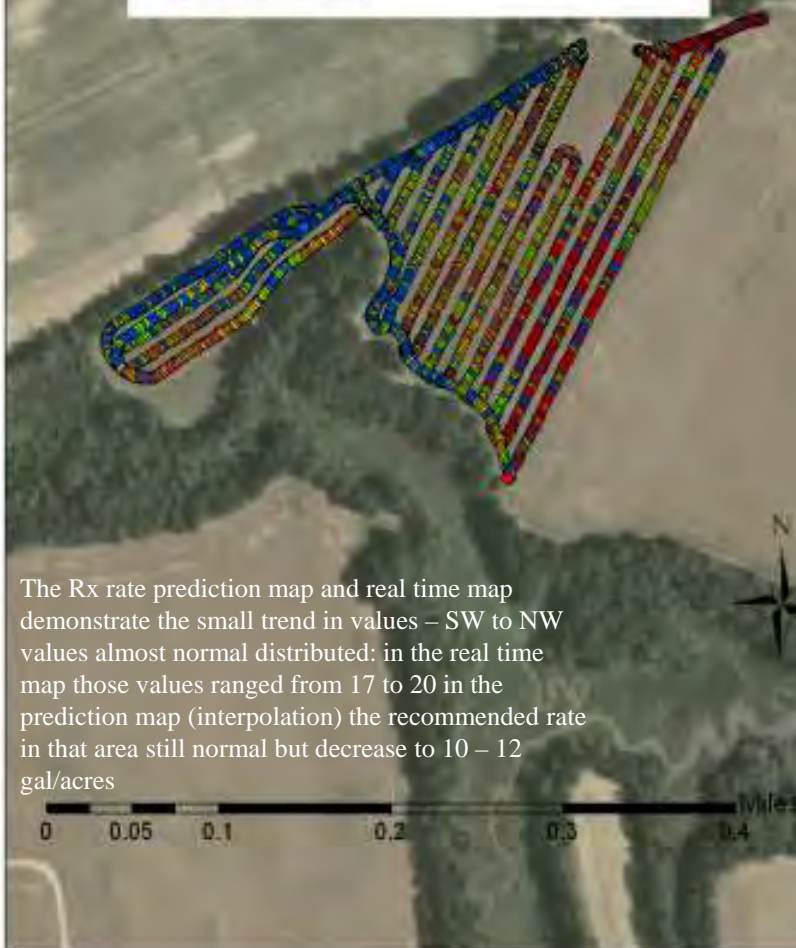

AVG of 16 site years

SS 8302 Recommended Nitrogen rates

RX_RATE

- 10.000 - 11.630
- 11.631 - 14.150
- 14.151 - 17.170
- 17.171 - 20.000
- 20.001 - 24.000

The Rx rate prediction map and real time map demonstrate the small trend in values – SW to NW values almost normal distributed; in the real time map those values ranged from 17 to 20 in the prediction map (interpolation) the recommended rate in that area still normal but decrease to 10 – 12 gal/acres

SS 8302 as applied Nitrogen rates (gal/acre)

RATE

- 3.300 - 12.700
- 12.701 - 15.700
- 15.701 - 18.400
- 18.401 - 25.200
- 25.201 - 38.700

SS 8302 Recommended Nitrogen rates

RX_RATE

- 10.000 - 11.630
- 11.631 - 14.150
- 14.151 - 17.170
- 17.171 - 20.000
- 20.001 - 24.000

Interpolation (IDV) values and Nitrogen rate application with soil series in Wesley Field (New Kent county)

The Rx rate prediction map and real time map demonstrate the small trend in values – SW to NW values almost normal distributed; in the real time map those values ranged from 17 to 20 in the prediction map (interpolation) the recommended rate in that area still normal but decrease to 10 – 12 gal/acres

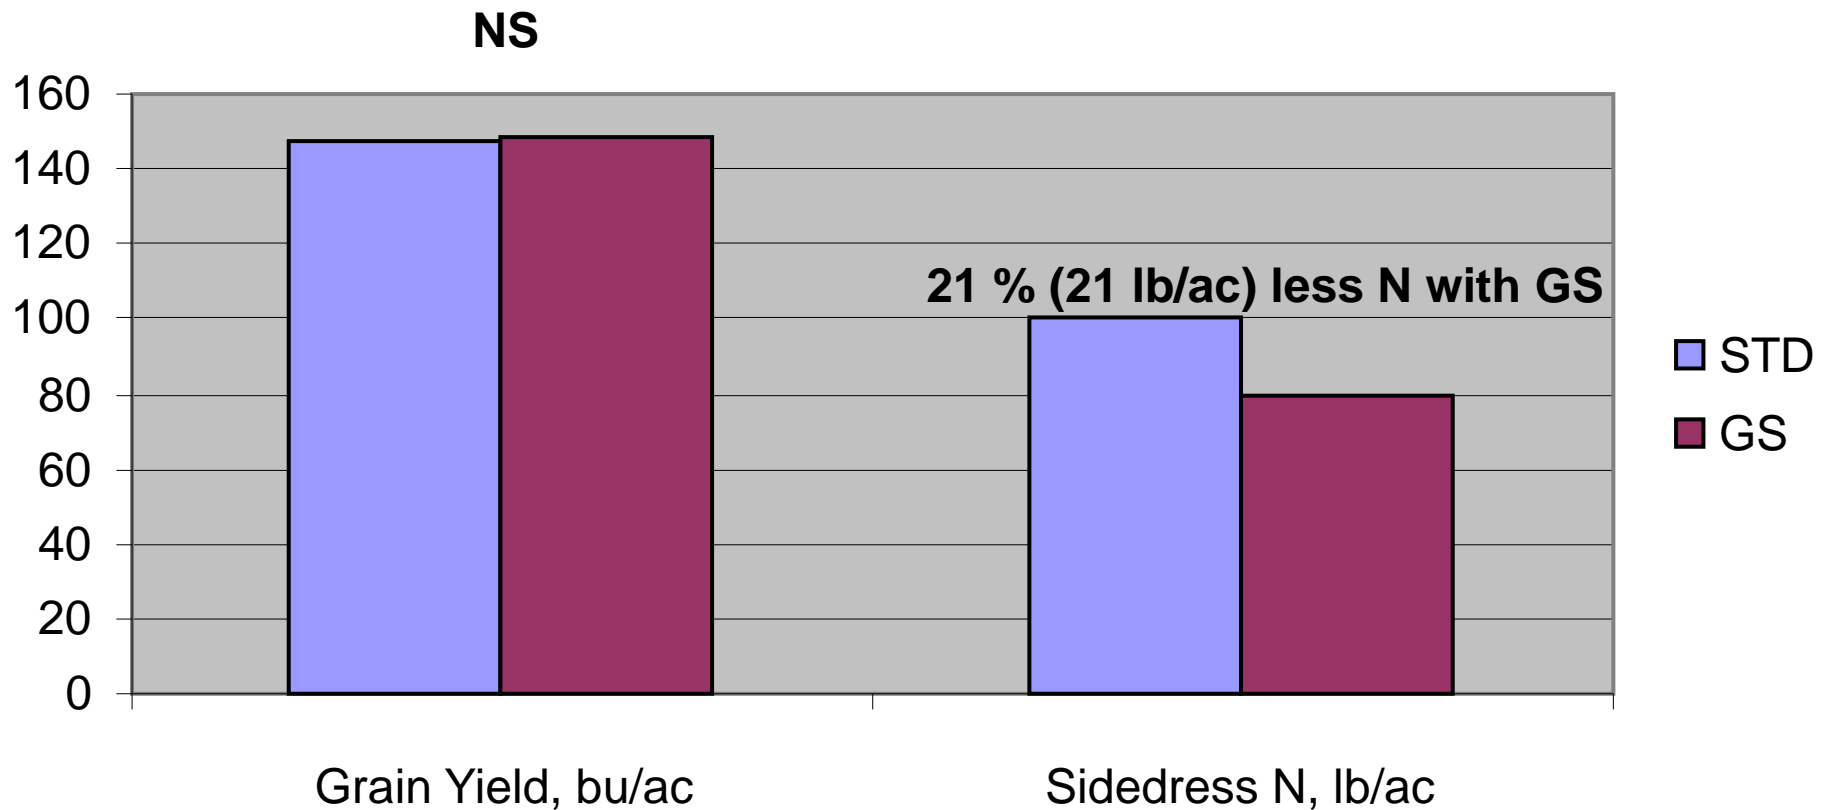

- 1A (Altavista fine sandy loam, 0 to 2 percent slope)
- 23A (Munden sandy loam, 0 to 2 percent slope)
- 26E (Nevarc-Remik complex, 15 to 25 percent slope)
- 2A (Altavista-Dogue complex, 0 to 2 percent slope)
- 30B (Pamunkey fine sandy loam, 2 to 6 percent slope)
- 42A (Wahwee silt loam, 0 to 2 percent slope)
- 5A (Altavista-Dogue complex, 0 to 2 percent slope)
- 5A (Conetoe loamy sand, 0 to 4 percent slope)

RATE

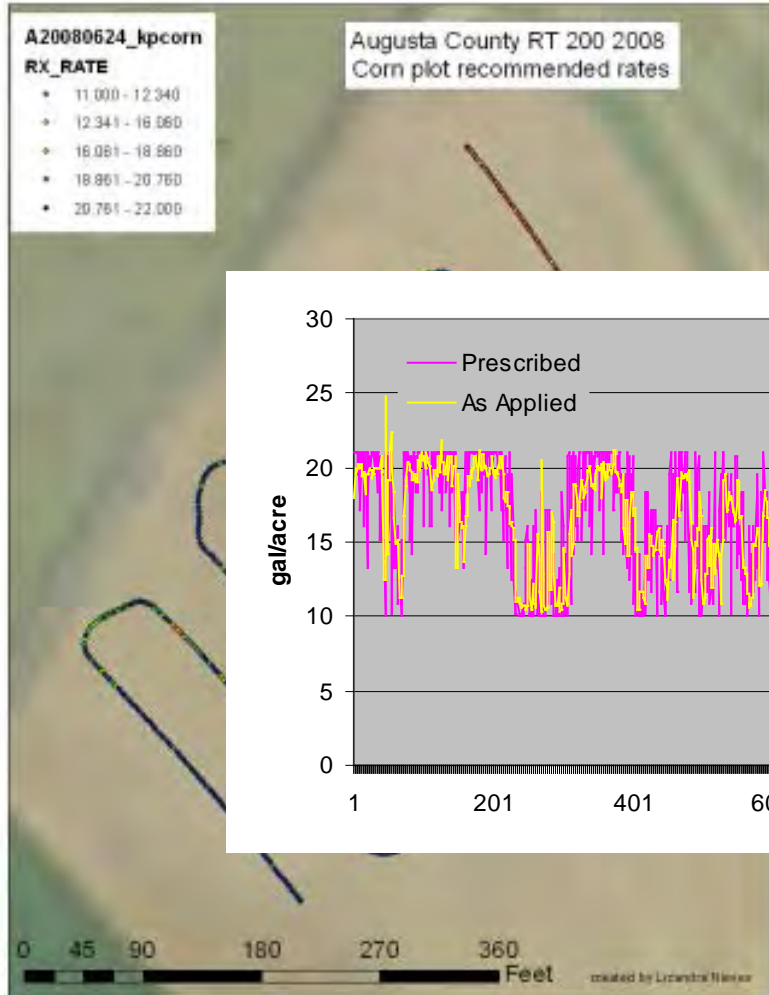

- ◇ -1.000 - 4.900 (less than 4.9 mostly outliers)
- ◇ 4.901 - 16.100
- ◇ 16.101 - 21.900
- ◇ 21.901 - 47.200
- ◇ 47.201 - 999.900

Augusta County RT 200 2008
Corn plot as applied rates

RX vs. Applied Rates

Challenges

- N rich strips
 - Timing
 - Same Field
 - Same Hybrid/Variety
 - Mark it!
- N “poor” strips

NDVI	Low_Ref	Hi_Ref
0.65	0.60	0.79

Challenges

- Herbicide Applications

Challenges

- Skepticism
- How to tell if the system was “right”
- Risk
- Cost
 - EQIP cost share
 - Tax credits
